

# How do I know my patient has a migraine?

Migraine is a type of primary headache disorder<sup>1</sup>

Visit [PfizerMedical](#) for more information

## Steps to diagnosing migraine and other primary headache types:

### 1 Patient history and physical examination

A thorough **headache history** is the **most** important tool in diagnosing **migraine**<sup>2</sup>

To aid **accurate diagnosis**, it is necessary to ask patients a series of **questions** on **symptoms** experienced and **severity** of migraine attacks<sup>3</sup>

A **physical examination** can determine other factors that may **exacerbate migraine** and include fundoscopy, palpation of head and neck, cardiovascular screening, and neurologic examination<sup>3</sup>

### Example questions when conducting a patient history of suspected migraine<sup>3,4</sup>

#### Pain pattern

- When and how do headaches **begin**?
- Are they **continuous** or **episodic**?
- How **long do headaches last**?
- How **frequent** is headache pain?
- Are there factors that **trigger** an attack?

#### Medical history

- Has there been any experience of **depression, anxiety and/or sleep disorders**?
- Are there any **comorbidities** such as asthma, hypothyroidism, hypertension?

#### Associated symptoms

- Do other **symptoms precede the attack**?
- Are there any **symptoms that accompany the attack** (e.g., nausea, photophobia, phonophobia)?

#### Treatment history

- What **previous and current treatments** have been taken and when?
- To exclude **medication overuse headache**,<sup>a</sup> what acute headache medications have been taken?
- What **non-headache treatments** been taken?
- If treatment was **discontinued**, why?

#### Family and social history

- Is there a **family history** of migraine?
- How have the headaches **impacted your lifestyle**?
- Have there been any **sleep disturbances**?

#### Nature of pain

- What is the **location** of the pain?
- How **severe** is the pain?

### 2 SNOOP is a red flag detection tool used to identify secondary headaches that warrant further investigation<sup>2,5,6</sup>

Red flags can be interpreted like screening tests identifying patients whose headache diagnosis is not known yet as having an elevated risk of a secondary headache;<sup>7</sup> if a primary headache diagnosis cannot be confirmed, particularly if secondary headache is suspected, patients should be referred to headache specialists.<sup>2</sup>

Red flag sign or symptom	History and examination findings	Secondary headache causes		Diagnostic workup
<b>S</b> ystemic	<ul style="list-style-type: none"><li>• Signs of infection (e.g., fever, chills, weight loss)</li><li>• History of HIV, immunosuppression, or malignancy<sup>2,5</sup></li></ul>	<ul style="list-style-type: none"><li>• Infection</li><li>• Malignancy</li></ul>	<ul style="list-style-type: none"><li>• Rheumatic disease</li><li>• Giant cell arteritis</li></ul>	<ul style="list-style-type: none"><li>• <b>Neuroimaging</b></li><li>• Lumbar puncture</li></ul>
<b>N</b> eurologic	<ul style="list-style-type: none"><li>• Abnormal neurologic examination</li><li>• Change in behavior or personality</li></ul>	<ul style="list-style-type: none"><li>• Malignancy</li><li>• Infection</li></ul>	<ul style="list-style-type: none"><li>• Inflammatory disorder</li></ul>	
<b>O</b> nset (sudden)	<ul style="list-style-type: none"><li>• Headache reaching peak intensity in &lt;1 minute (thunderclap<sup>8</sup>)</li></ul>	<ul style="list-style-type: none"><li>• Subarachnoid hemorrhage</li><li>• Stroke</li></ul>	<ul style="list-style-type: none"><li>• RCVS</li></ul>	<ul style="list-style-type: none"><li>• Head CT</li><li>• Lumbar puncture (if CT negative)</li></ul>
<b>O</b> lder age at onset	<ul style="list-style-type: none"><li>• New onset headache at age &gt;50 years</li></ul>	<ul style="list-style-type: none"><li>• Malignancy</li><li>• Infection</li></ul>	<ul style="list-style-type: none"><li>• Giant cell arteritis</li></ul>	<ul style="list-style-type: none"><li>• MRI</li></ul>
<b>P</b> attern change	<ul style="list-style-type: none"><li>• Change in headache pattern or characteristics</li><li>• Progressive headache, loss of headache-free periods</li></ul>	<ul style="list-style-type: none"><li>• Malignancy</li><li>• Inflammatory or vascular disorder</li></ul>		
<b>P</b> recipitated by Valsalva maneuver	<ul style="list-style-type: none"><li>• Headache precipitated by Valsalva manoeuvre, sneezing, coughing, or exercise</li></ul>	<ul style="list-style-type: none"><li>• Chiari malformation type 1</li><li>• Posterior fossa lesions</li><li>• Malignancy</li></ul>	<ul style="list-style-type: none"><li>• Arachnoid cysts</li><li>• Subdural hematoma</li><li>• Intracranial hypertension or hypotension</li></ul>	<ul style="list-style-type: none"><li>• <b>Neuroimaging</b></li></ul>
<b>P</b> ostural	<ul style="list-style-type: none"><li>• Headache precipitated or aggravated by postural change</li></ul>	<ul style="list-style-type: none"><li>• Intracranial hypertension</li><li>• Intracranial hypotension</li></ul>		<ul style="list-style-type: none"><li>• <b>Neuroimaging</b></li><li>• Lumbar puncture</li><li>• MRI with gadolinium</li></ul>
<b>P</b> apilledema	<ul style="list-style-type: none"><li>• Papilledema, visual obscurations, diplopia, or field defects</li></ul>	<ul style="list-style-type: none"><li>• Intracranial hypertension</li><li>• Malignancy</li></ul>	<ul style="list-style-type: none"><li>• Inflammatory disorder</li></ul>	<ul style="list-style-type: none"><li>• Thorough fundoscopic examination</li></ul>

### Consider neuroimaging only when a secondary headache disorder is indicated as a **red flag**<sup>9</sup>

- MRI is preferred to CT as it provides a **higher resolution** and avoids harmful **exposure** to ionizing **radiation**; however, it can also detect **clinically insignificant findings** (such as white matter lesions) which can alarm patients and lead to further unnecessary evaluations

<sup>a</sup>Medication overuse: ≥15 days/month use of simple (non-opioid) analgesics for >3 months; ≥10 days/month use of opioids, triptans, ergotamines, or their combination analgesics for >3 months.<sup>1</sup>

### 3 3-item ID Migraine™ is one of several screening tools for migraine diagnosis<sup>10</sup>

- The **ID Migraine** diagnostic aid is a **validated, reliable** tool that is helpful to assess **pain** and **functional activity** in previously undiagnosed individuals<sup>10,11</sup>
- It consists of **3 core questions** regarding headache-associated **disability, nausea, and photophobia**, and can aid with migraine recognition<sup>10</sup>

Has a headache limited your activities for a day or more in the last 3 months?

Are you nauseated or sick to your stomach when you have a headache?

Does light bother you when you have a headache?

A migraine diagnosis is likely if patients respond affirmatively to **≥2 items**  
Testing positive for **≥2 items** yields a sensitivity of 0.81 (95% confidence interval 0.77–0.85)<sup>10</sup>

### 4 Differential diagnoses: characteristics of primary headache disorders (headache duration/features/frequency)<sup>9,12</sup>

#### Migraine<sup>2,9,12</sup>

##### Headache characteristics:

Usually unilateral in location (can be bilateral)

**4–72 hours**

**Moderate or severe intensity**

Usually pulsating/throbbing pain

##### Accompanying symptoms:

Photophobia, phonophobia, nausea, vomiting

May be aggravated by or cause avoidance of routine physical activity

- EPISODIC:** <15 headache days/month
- CHRONIC:** ≥15 headache days/month for more than 3 months

#### Tension-type headache<sup>9</sup>

##### Headache characteristics:

Typically bilateral or circumferential

**Hours to days<sup>a</sup>**

**Mild or moderate intensity**

Usually pressing or tightening pain

##### Accompanying symptoms:

Often none; sometimes photophobia or phonophobia (but not both) and mild nausea in chronic tension-type headache

Not aggravated by routine physical activity

#### Cluster headache<sup>1,2,9,13</sup>

##### Headache characteristics:

Strictly unilateral and orbital, supraorbital, and/or temporal

**15–180 minutes**

**Severe or very severe intensity**

Overwhelming, sharp/stabbing pain

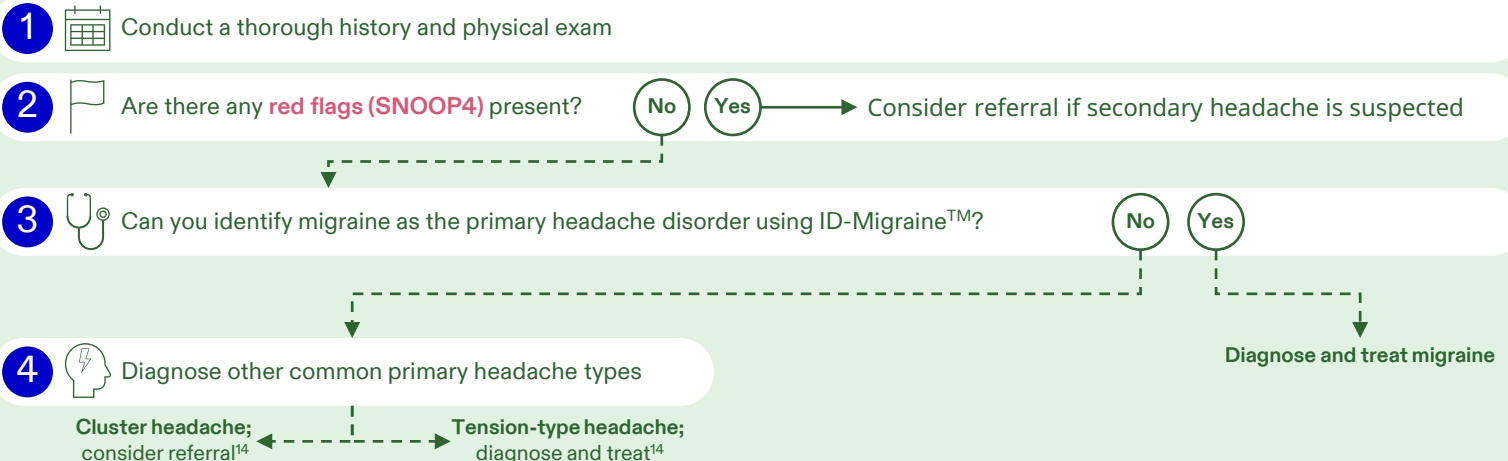

##### Accompanying symptoms:

Ipsilateral to the headache: cranial autonomic symptoms, e.g., conjunctival injection,<sup>b</sup> lacrimation and nasal congestion

Associated with restlessness or agitation

- EPISODIC:** ≥2 cluster periods<sup>c</sup> lasting from **7 days to 1 year** (when untreated) separated by **pain-free remission periods of ≥3 months**
- CHRONIC:** headache attacks occurring **without a remission period**, or with **remissions lasting <3 months, for ≥1 year**

### Summary: overarching algorithm for diagnosing migraine<sup>2</sup>

<sup>a</sup>Or unremitting; <sup>b</sup>Increased redness of the eye due to enlargement of conjunctival vessels<sup>15</sup>; <sup>c</sup>Cluster headache attacks occur in series lasting for weeks or months (so-called cluster periods) separated by remission periods usually lasting months or years.<sup>1</sup>

**Abbreviations:** CT, computed tomography; HIV, human immunodeficiency virus; ID, identification; MRI, magnetic resonance imaging; RCVS, reversible cerebral vasoconstriction syndrome.
